His YouTube channel has some of the demonstrations for solving math and reading problems, and he gives tips and shortcuts for tackling the "problem solving."Many of the math questions for the SAT and ACT are based on Geometry and Algebra," Steve points out. "Students often take the tests while doing homework from pre-calculus and trigonometry classes. No wonder many students are stumped. They are out of practice and they are working on Trig or Algebra 2 when the tests are asking for lower math skills. Another difficulty comes because the focus of many geometry classes is "finding the missing step in the proof" and "which theorem should we use?" Steve's tips help you increase your "processing speed" -- it's like upgrading your computer's chip. Some students find that they can get through to the end of the test and have time to check the problems that they skipped. The second part of his book answers the question, "Do you want a higher test score or do you want to get into a great college for you?" Pulling on his experience as a high school advisor, he shows you how to get free ebooks and set up a free website to highlight your achievements, skills and abilities. This is not your typical list of tips for getting a higher test score. This is a collection of procedures for finding free resources. Algebra Essentials Practice Workbook with Answers: Linear and Quadratic Equations, Cross Multiplying, and Systems of Equations Chris McMullen, Ph.d. 2010-07-12 This Algebra Essentials Practice Workbook with Answers provides ample practice for developing fluency in very fundamental algebra skills – in particular, how to solve standard equations for one or more unknowns. These algebra 1 practice exercises are relevant for students of all levels – from grade 7 thru college algebra. With no pictures, this workbook is geared strictly toward learning the material and developing fluency through practice. This workbook is conveniently divided up into seven chapters so that students can focus on one algebraic method at a time. Skills include solving linear equations with a single unknown (with a separate chapter dedicated toward fractional coefficients), factoring quadratic equations, using the quadratic formula, cross multiplying, and solving systems of linear equations. Not intended to serve as a comprehensive review of algebra, this workbook is instead geared toward the most essential algebra skills. Each section begins with a few pages of instructions for how to solve the equations followed by a few examples. These examples should serve as a useful guide until students are able to solve the problems independently. Answers to exercises are tabulated at the back of the book. This helps students develop confidence and ensures that students practice correct techniques, rather than practice making mistakes. The copyright notice permits parents/teachers who purchase one copy or borrow one copy from a library to make photocopies for their own children/students only. This is very convenient for parents/teachers who have multiple children/students or if a child/student needs additional practice. An introduction describes how parents and teachers can help students. We make the most of this workbook. Students are encouraged to time and score each page. In this way, they can try to have fun improving on their records, which can help lend them confidence in their math skills.

Model-Based Clustering and Classification for Data Science Charles Bouveyron 2019-09-30 Cluster analysis finds groups in data automatically. Most methods have been heuristic and leave open such central questions as: how many clusters are there? Which method should I use? How should I handle outliers? Classification assigns new observations to groups given previously classified observations, and also has open questions about parameter tuning, robustness and uncertainty assessment. This book frames cluster analysis and classification in terms of statistical models, thus yielding principled estimation, testing and prediction methods, and sound answers to the central questions. It builds the basic ideas in an accessible but rigorous way, with extensive data examples and R code; describes modern approaches to high-dimensional data and networks; and explains such recent advances as Bayesian regularization, non-Gaussian model-based clustering, cluster merging, variable selection, semi-supervised and robust classification, clustering of functional data, text and images, and co-clustering. Written for advanced undergraduates in data science, as well as researchers and practitioners, it assumes basic knowledge of multivariate calculus, linear algebra, probability and statistics.

A variety of problems are included, such as: systems of equations (many are nonstandard, including a quadratic term or a reciprocal, for example) simplifying expressions or solving equations that feature square roots applying algebra to derive equations variables in the denominator rules for exponents inequalities the equation for a straight line multiplying, distributing, or factoring expressions applications of algebra (such as in classic physics problems) transformations of variables exposure to techniques such as completing the square, partial fractions, or separation of variables cross multiplying ratios rationalizing the denominator and multiplying by the conjugate This book is NOT indented to "teach" algebra (though the solutions may be instructive), but is designed to offer practice with a variety of algebra skills (which most students could benefit from) for students who are familiar with the skills listed. The author, Chris McMullen, Ph.D., has over twenty years of experience teaching math skills to physics students. He prepared this workbook of the Improve Your Math Fluency series to share his strategies for solving algebra problems.
